24 Metadata has its own predicates

Source

```
- <definedName name="Print_Area"
-  localSheetId="0">S!$A$1</definedName>
  <definedName name="_xlnm.Print_Area"
   localSheetId="0">S!$A$1</definedName>
```

Guarded result

```
  <definedName name="_xlnm.Print_Area"
   localSheetId="0">S!$A$1</definedName>
```

Match a built-in alias and its prefixed counterpart in the same raw local scope. Keep names on different sheets distinct.

Unsafe shortcut. The current predicate does not compare formula bodies. This example must not imply general semantic equivalence.

Abbreviated XML. Style IDs are local.
