Every live state controls the split

Abbreviated Rust implementation

```
let measured = measure(&batch)?;
ensure!(
    measured.len() == batch.len(),
    "Incomplete geometry batch coverage"
);
for (candidate, geometries) in
    batch.into_iter().zip(measured)
{
    for geometry in geometries.values() {
        geometry.validate()?;
    }
    // Split if any live state is too large.
}
```

The planner measures the same candidate in every live state. A hidden range in one workbook can be visible in its partner. Any oversized state forces further partitioning.

A missing measurement is an error. Zero-area leaves retain an observation. A single oversized cell fails instead of disappearing.
