21 Translate shared references by axis

Source

```
<c r="D166"><f t="shared" si="0"
 ref="D166:J166">D91/D64*100-100</f></c>
<c r="E166"><f t="shared" si="0"/></c>
<!-- hidden E64 = 4232.35 -->
```

=

Retained by the guard

```
<c r="D166"><f t="shared" si="0"
 ref="D166:J166">D91/D64*100-100</f></c>
<c r="E166"><f t="shared" si="0"/></c>
<!-- hidden E64 = 4232.35 -->
```

Translate relative axes over the follower range. Absolute axes remain fixed. Protect enclosing rectangles without enumerating every formula. In this example the protected input rectangles include D91:J91 and D64:J64.

Unsafe shortcut. Scanning only the anchor misses E64 and can produce DIV/0 errors after rebuilding.

Abbreviated XML. Style IDs are local.
