41 Local references stay on their sheet

Source

```
<!-- formulas on worksheet Other -->
<c r="T1"><f>S41</f></c>
<c r="T2"><f>Input!S41</f></c>
```

Decision

```
<!-- Protect Other!S41. -->
<!-- Protect Input!S41 separately. -->
```

An unqualified S41 belongs to Other. Only the qualified formula protects Input!S41. Resolve local defined names in their own sheet scope too.

Unsafe shortcut. A global coordinate set would retain or delete the wrong sheet's candidate. Unknown scope needs conservative handling.

Abbreviated XML. Style IDs are local.
